Regenerating the Business Manual

How the onboarding guide is built, and how to rebuild it

Regenerating the manual

`Laawol-Business-Onboarding.pdf` is the guide handed to businesses when they join. Its screenshots come from the **live console**, so it needs regenerating whenever the console changes materially.

Everything lives in `docs/manual/`:

FILE	WHAT IT IS
<code>business-onboarding.html</code>	The manual's source. Edit this to change wording or structure.
<code>capture-console.mjs</code>	Captures every console section as a PNG.
<code>capture-extra.mjs</code>	Captures sub-sections the section pass misses — see step 2b.
<code>screenshots/</code>	Captured images. <code>web-*</code> console, <code>app-*</code> mobile.
<code>Laawol-Business-Onboarding.pdf</code>	The rendered output — the file you send to businesses.

STEP 1 Copy a signed-in Chrome profile

The console requires a sign-in, so the capture reuses an existing session. It runs against a **copy** of the profile — that way the session carries over without holding a lock on the profile Chrome is using, and you can keep working while it runs.

```
# Skip the caches, or the copy is well over a gigabyte
SRC="$HOME/Library/Application Support/Google/Chrome"
DST=/tmp/chrome-capture-profile
rm -rf "$DST" && mkdir -p "$DST/Profile 1"
cp "$SRC/Local State" "$DST/"
rsync -a --exclude 'Cache' --exclude 'Code Cache' --exclude 'GPUCache' \
  --exclude 'Service Worker/CacheStorage' --exclude 'blob_storage' \
  "$SRC/Profile 1/" "$DST/Profile 1/"
```

Check that `Local Storage`, `IndexedDB`, and `Cookies` made it into the copy — those carry the session. If the capture comes out showing a sign-in page, one of them is missing.

STEP 2 Capture the console

```
node docs/manual/capture-console.mjs \
  /tmp/chrome-capture-profile \
  docs/manual/screenshots
```

It launches headless Chrome, clicks each sidebar section in turn, waits for Firestore rows to stream in, and writes one PNG per section. Roughly two minutes for twelve sections.

Capture from an account with real data. A fresh business has empty queues, and a manual full of empty panels teaches nothing. The current screenshots come from an account with live shipments, listings, and reviews.

STEP 2B Capture the sub-sections

```
node docs/manual/capture-extra.mjs \  
  /tmp/chrome-capture-profile \  
  docs/manual/screenshots
```

Step 2 clicks a sidebar item and shoots the viewport, so it only ever captures the **top** of a long page. *Services & coverage* is really four stacked sections — services, rules, locations, coverage — and only the first is above the fold. This pass scrolls to each one by its heading and captures it.

Scroll by the smallest matching element, not the first. `<body>` contains every heading's text, and so does the sidebar, so "first element containing the text" scrolls nowhere. The script filters to the element with no matching child. If a capture comes back showing the top of the page, that filter stopped matching — the heading text changed.

STEP 3 Capture the mobile app

Boot a simulator with the app installed and signed in as a customer:

```
xcrun simctl list devices | grep Booted  
xcrun simctl io <UDID> screenshot docs/manual/screenshots/app-01-home.png
```

This reads the simulator's framebuffer directly, so it needs no screen-recording permission and never captures anything outside the simulator.

STEP 4 Render the PDF

```
cd docs/manual  
"/Applications/Google Chrome.app/Contents/MacOS/Google Chrome" \  
  --headless=new --disable-gpu --no-pdf-header-footer \  
  --virtual-time-budget=20000 \  
  --user-data-dir=/tmp/pdfprof \  
  --print-to-pdf="$PWD/Laawol-Business-Onboarding.pdf" \  
  "file://$PWD/business-onboarding.html"
```

Chrome writes the PDF and then does not exit. The file is complete before it hangs — wait for it to appear, then kill the process. Don't take the hang as a failure and rerun; you'll just hang again.

Why it is scripted rather than screenshotted by hand

Two problems make manual capture the wrong approach, and both bit during authoring.

A screen grab photographs whatever is on screen

`screencapture` captures what is genuinely visible, so it depends on the right tab being frontmost and will happily include other windows, notifications, or private content. During authoring it caught an unrelated browser tab, the desktop, and a password prompt — three captures that had to be deleted. Headless capture makes that impossible: nothing outside the page is ever in frame.

The console has no URL routing for tabs

The active section is React state, not a URL. So a one-shot `--screenshot` against a URL can only ever produce the *Today* tab, no matter which section you want. `capture-console.mjs` drives Chrome over the DevTools Protocol instead: it clicks each sidebar item and captures what renders. Node 22 ships a WebSocket, so this needs no dependencies.

Changing the manual's content

Edit `business-onboarding.html` and re-run step 4. You only need steps 1–3 when the console's appearance has actually changed.

The guide is deliberately written in **setup order** — approval, verification, services, destinations, payouts, staff — because that is the sequence a new business experiences, and each step genuinely depends on the one before it. The operational sections come afterwards and use the populated account so the screenshots show something real. Keep that shape if you extend it.

Known gaps

- **Parking has no screenshot.** The captured business doesn't offer it, so the console correctly shows "Not offered". The guide covers parking in text only. To screenshot it, enable Car parking in *Services & coverage* on the capture account first.
- **Shared barrels is deliberately absent.** The panel is gated on `appConfig/client.sharedBarrelsEnabled` (`lib/feature-flags.ts`), which is not set in production — so the feature is off for every business, not just the capture account. It stays out of the guide until that flag ships. The *Destinations* tab is reachable only from inside that same gated block, which is why country coverage is documented from the *4 · Coverage* section of *Services & coverage* instead.
- **This is the business half.** A customer-facing guide would be a separate document; the `app-*` screenshots already captured would carry over to it.
